

Email Rendering Report

Purpose

I tested how my HTML email for the Pastafarian Newsletter Project rendered across different platforms. The goal was to confirm that all visual elements, animations, and interactivity functioned correctly in both desktop and mobile clients.

Test Setup

The email HTML file was built using responsive layouts, keyframe animations, and hover-based interactivity. Tests were performed using both desktop and mobile email clients to ensure compatibility.

Clients tested:

- Gmail (Desktop)
- Apple Mail (iPhone)

Results

Gmail on Desktop:

- The layout and text displayed correctly with all columns properly aligned.
- Images loaded as expected, including the Flying Spaghetti Monster logo and related visuals.
- Hover animations such as pulse, hover grow, and rotate worked smoothly on interactive elements.
- The 'Learn More About FSM' button functioned correctly and redirected to the intended link.
- The layout adapted properly when resizing the viewing window.

Apple Mail on iPhone:

- The responsive layout functioned correctly with stacked columns on smaller screens.
- All images displayed and scaled appropriately.
- Interactive animations triggered correctly when tapping or hovering.
- Some spacing adjustments appeared between sections due to iOS rendering behavior.
- Text slightly reduced in size to accommodate smaller screens but remained readable.

Conclusion

The email rendered successfully across both desktop and mobile clients. All visual elements, animations, and links functioned as intended, maintaining consistency with the project's intended design and theme.
